四、閱讀測驗【請在下列各題中選出最適當的答案】

第一篇：

Japan is no stranger to earthquakes, and as many as 1,500 can be recorded yearly. Minor tremors occur almost every day. Japan has this many earthquakes because four tectonic plates converge below the country's surface. The ever-present threat of quakes turned the country into a world leader in earthquake-proof construction.

In Japan, all modern structures have been designed for seismic activity. Strong building codes are in place for structures of every size. Buildings less than three stories high must have reinforced walls and large foundation slabs. Those of

at least three stories have even stricter rules. They are often disconnected from the land around them, a technique called base isolation. They rest on huge rubber or fluid-filled shock absorbers that take the excess energy from an earthquake and convert it into heat. The taller a building is, the greater the risk. Very tall buildings must rest on some sort of shock absorption system. They must be able to sway from side to side without sustaining permanent damage. The top of a building, for example, may need to move as much as three meters in either direction.

These ideas are all very modern, but newer technology and ideas are always being tested. Recently, Japanese engineers have taken the idea of base isolation to another level. They have devised a system that actually raises a building during an earthquake via a cushion of air. The air is forced between the building and the foundation. This lifts the building up to three centimeters off the ground when necessary. Additionally, more diverse building materials are being considered. One Japanese architect has designed structures that utilize cardboard tubes and wood. These materials result in a much lighter building than one made of concrete. Plus, they perform better during tremors.

Earthquakes can be frightening and dangerous, but the **casualties** caused by collapsed buildings are avoidable. Some of the smartest minds have been working hard to keep people safe from earthquakes. And they will continue to find new ways of doing so in the future.

(2)41. What is the cause of frequent earthquakes in Japan, according to the passage?

Nowadays, online interactions can greatly affect one's image, and youngsters spend a lot of time and effort cultivating the impressions they want to present to the world on the Internet. A research conducted by Ditch the Label, an anti-bullying charity, suggests social media and cyberbullying are the major source of anxiety for youngsters.

More than 10,000 people aged 12 to 20 took part in the survey, with nearly 70 percent of them confessing to having said mean words to another person online, and 17 percent claiming to have been bullied online. Instagram was highlighted as the vehicle most used for insulting comments, and appearance was cited as the most likely topic for abuse. Furthermore, 40 percent of the young people said they would feel upset if nobody liked their selfies, and 35 percent said

their confidence was connected to the followers they had. More and more people judged a person by the life he or she led online, so 47 percent of the teenagers avoided discussing negative things in their lives on social media. Instead, many preferred presenting an edited version of their lives.

“ There is a trend towards people **augmenting** their personalities online and not showing the reality, ” said Liam Hackett, Ditch the Label ’ s chief executive. “ Not only is the Internet redefining the climate of bullying, but it is also having clear impacts upon the identity, behavior, and personality of its young users. ”

Anne Longfield, the children's commissioner for England, called for “ compulsory digital citizenship classes ” in schools and suggested that a government organization should be established to help cyberbullied children. Another expert also pointed out that adults and teens alike should think about their usage of social networks, and that there is more to life than the glossy pictures on the Internet.
